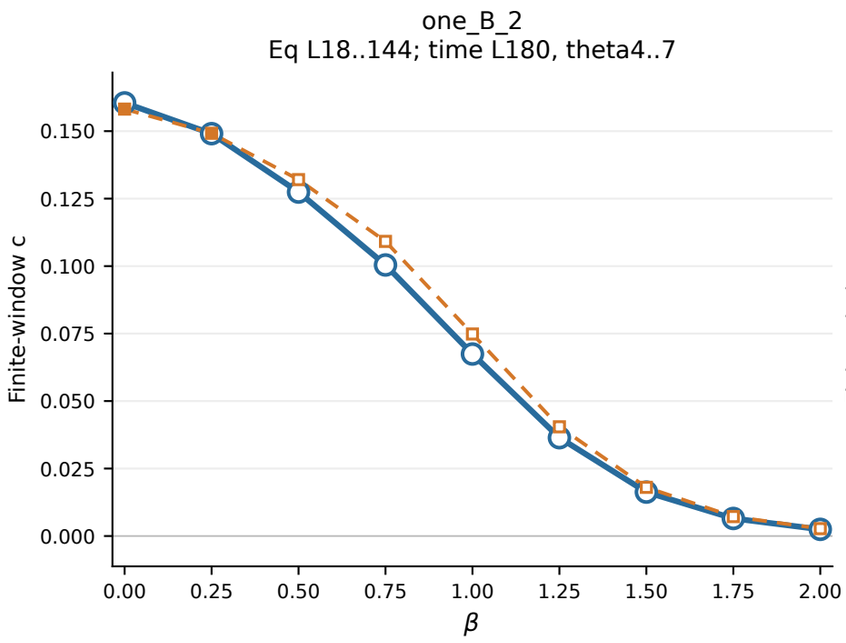
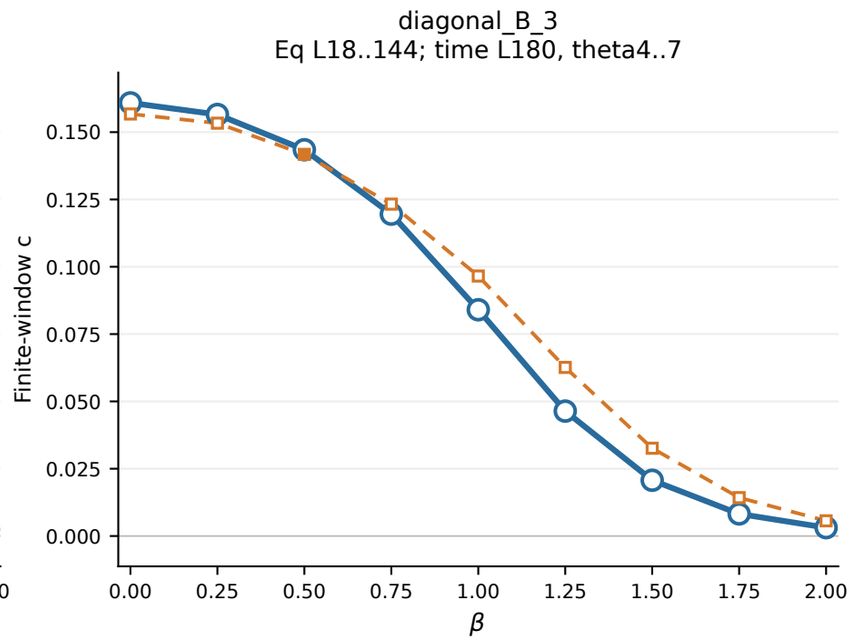
Seven reachable examples: finite-window equilibrium / time coefficients

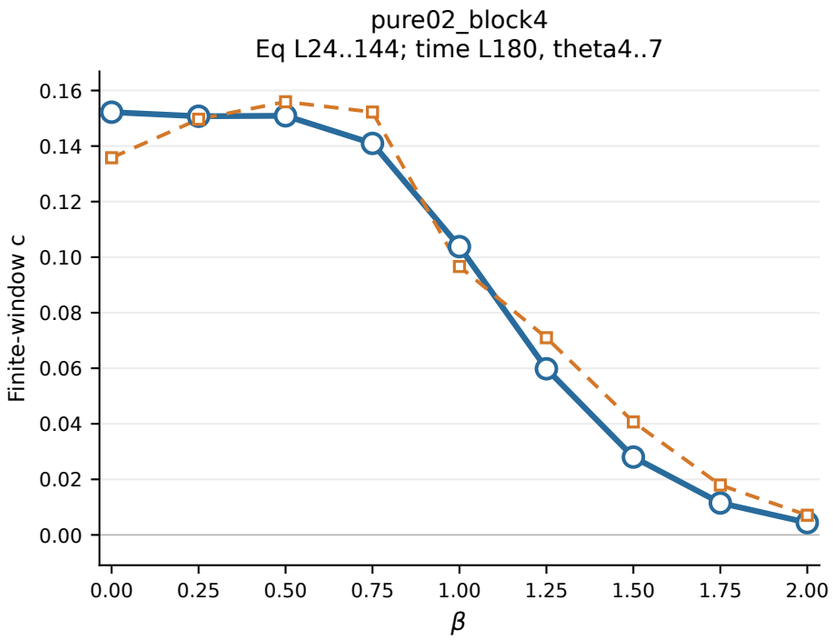
Independent y scales. Large blue open circles: equilibrium. Small orange squares: time; filled = local pass, open = unresolved.
Overview omits sensitivity bands; individual result figures retain them. No 2 x 2 blocked pattern is included.

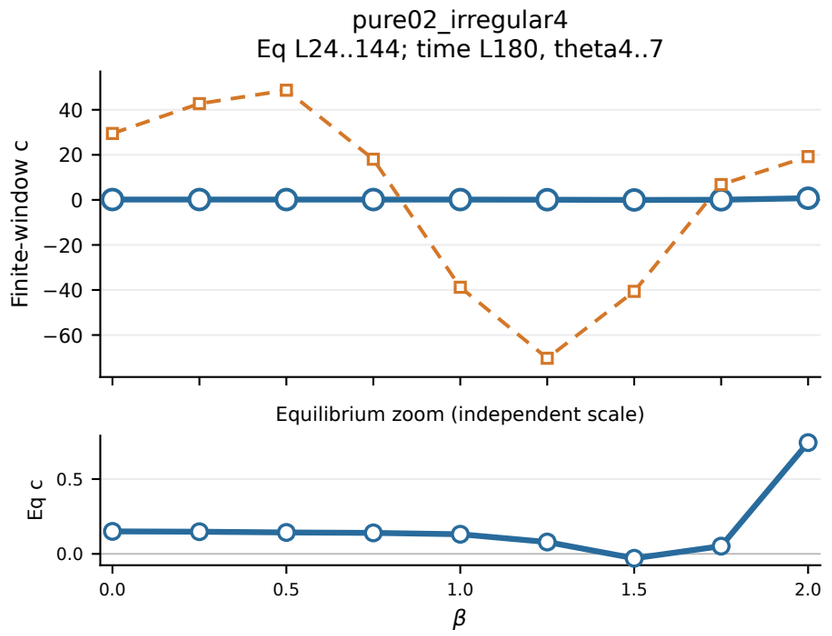
Class 1 | One particle in every cell



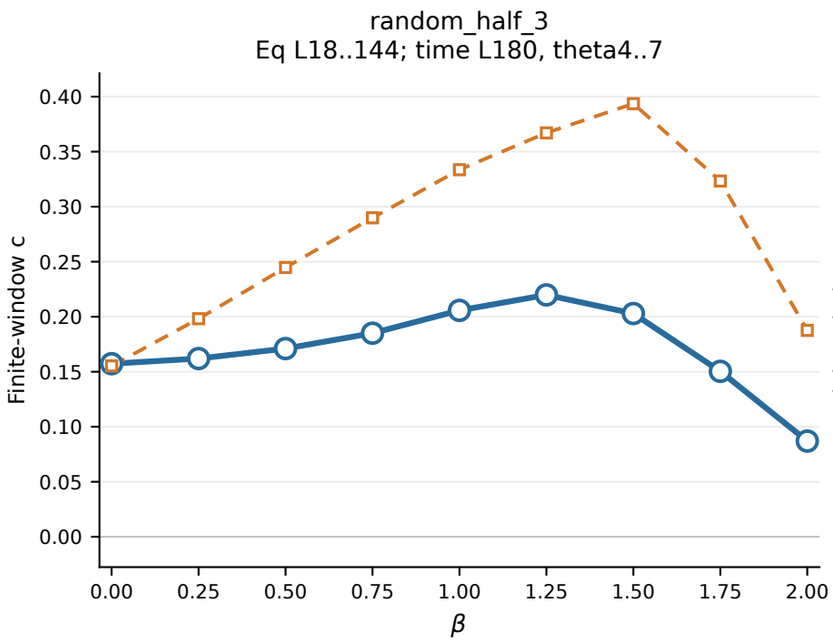


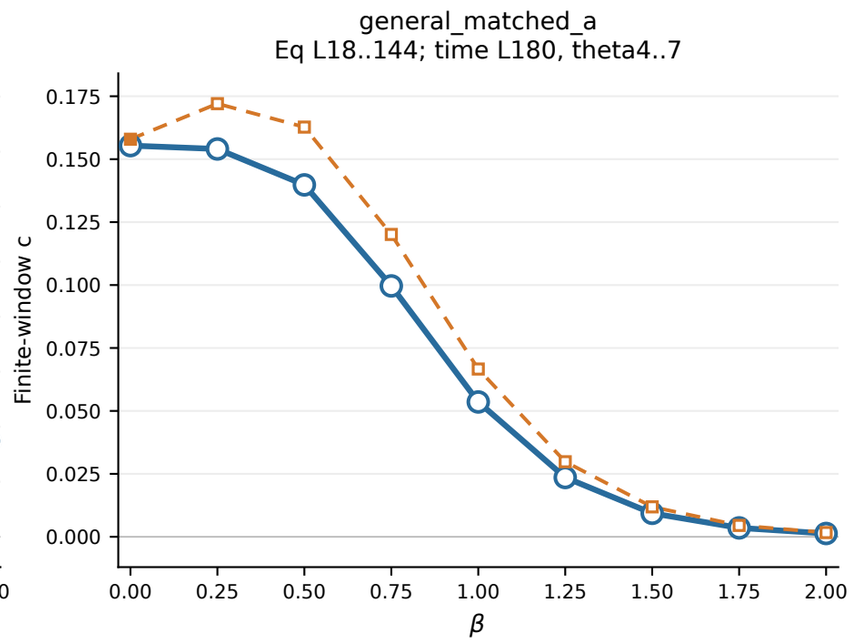
Class 2 | Empty and doubly occupied cells only

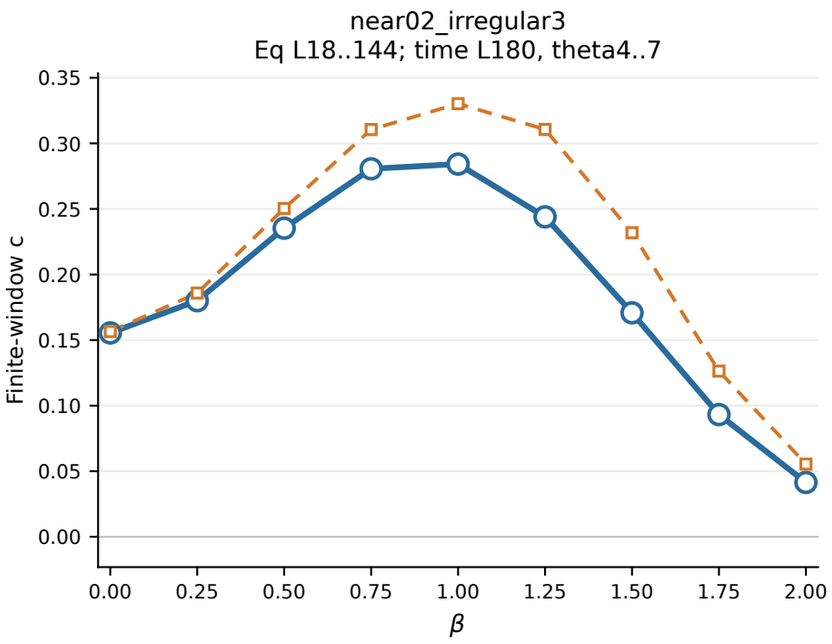




Class 3 | Empty, single and double cells coexist







A fitted coefficient remains unresolved when time checks fail. Local pass is not an asymptotic proof.
Original six patterns + near02_irregular3, nine beta values each (63 distinct pattern-beta pairs).
