Deterministic $\beta = 0$ baseline | staggered $+\mu$ on A, $-\mu$ on B
Chosen state: visible finite-size curvature
Direct $\mu = 10^{-8}$
$b + c \ln L$, c=0.2101
$b + c \ln L + d/L$, c=0.1565
$D = (2S_A + S_C)/3 - S_B$
$\ln L$
Window/model spread is not a statistical CI
log only
log + 1/L

Finite-window c_{fit}
Lower size cutoff $L_{\min}$ ($L_{\max} = 36$)
Zero-mode comparison: separate state families
chosen $\mu = 10^{-8}$
legacy LAPACK zero modes (L<=24)
D
$\ln L$
Strip entropy: linear L axis
S_A, chosen state
S_C, chosen state
Second Renyi entropy
L
No Monte Carlo error bars. For L<=24, changing mu from 1e-8 to 1e-9 changes D by at most 9.8e-09.
Finite mu is gapped at asymptotically large L; these sizes satisfy mu L << 1. Fits are finite-window diagnostics.
