(a) z_{half} is L-independent; curve is non-monotone at finite L
κ_a/t
$z = a\,t = L^2 e^{-2\beta}$
$a \to \infty$: $2[1 + I_1(2z)/I_0(2z)]$
$L = 6$ ($a = 36$)
$L = 12$ ($a = 144$)
$L = 24$ ($a = 576$)
$L = 36$ ($a = 1296$)
$L = 60$ ($a = 3600$)
$L = 200$ ($a = 40000$)
halfway $z = 0.580$
(b) $\propto L^{-0.01}$ vs $\propto L^{0.97}$ vs $\propto L^{0.81}$
channel peak, $\propto L^{0.97}$
channel $z_{\text{half}}(L)$, $\propto L^{-0.01}$
entropy $z_*(L) \propto L^{0.81}$
crossover z
L
(c) both forms are 2-param fits to 6 points; linear is only 50% worse in log-rms
$\ln z_* - \ln(\text{model})$
power $0.348L^{0.81}$: rms 0.037
linear $0.156L + 0.659$: rms 0.060
L
